

**Amendments to the Claims:**

1. (canceled)

2. (canceled)

3. (canceled)

4. (currently amended) A dual computer display system comprising:

a first computer display connected to a computer having a first image surface for displaying a first computer image; and

a second computer display pivotably connected at a pivotable connection to the first computer display having a second image surface for displaying a second computer image and moveable about at least two generally orthogonal axes about the pivotable connection, wherein the second computer display can assume a lateral operating position in which the first and second computer displays are oriented laterally and the second image is viewable by a person viewing the first image, and wherein the pivotable connection connects one of the first computer display and the second computer display to a corner of the other one display.

5. (currently amended) A computer display support structure comprising:

a support member; and

a support arm connected to the support member, said support arm capable of supporting toward one end thereof a first computer display that displays a first image, and said support arm capable of supporting toward an opposite end thereof a second computer display that displays a second image, at least one of the ends being moveable between a first operating position in which the second image is viewable by a first person viewing the first image and a second operating position in which the second image is viewable by a second person opposite the first person viewing the first image, wherein at least one of the ends is extendable between a retracted configuration and an extended configuration, thereby varying the distance between the first and second computer displays.

6. (canceled)

7. (previously presented) A dual computer display system according to Claim 4, wherein the second computer display is moveable between a vertical operating position in which the first and second computer displays are oriented vertically and the second image is viewable by the person viewing the first image; the lateral operating position; and, an opposite position in which the second image is viewable by another person opposite the person viewing the first image.

8. (previously presented) A dual computer display system according to Claim 7, wherein the second computer display is further moveable to a stored position in which the second image surface faces the first image surface.

9. (currently amended) A computer display support structure according to Claim 5 48, wherein both ends are extendable between the retracted and the extended configurations.

10. (previously presented) A computer display support structure according to Claim 5, wherein the at least one of the ends is hinged along its length and is extendable along a portion between the hinge and support member.

11. (presently amended) A computer display support structure according to anyone of Claims 5, 9 or 10, ; further comprising a joint on the support arm for connecting one of the first computer display and the second computer display to the support arm, wherein the joint allows the one display to pivot.

12. (previously presented) A computer display support structure according to Claim 11, wherein at least one of the first and second computer displays is pivotable between a portrait and landscape orientation.

13. (previously presented) A computer display support structure according to claim 12, wherein the ends are oriented vertically when the structure is in the first operating position.

14. (previously presented) A computer display support structure according to Claim 12, wherein the ends are oriented laterally when the structure is in the first operating position.

15. (previously presented) A computer display system comprising:

a support member;

a support arm extending from the support member; and

two computer displays pivotably connected to opposite ends of said support arm, each said computer display being pivotable about a respective pivot point between a first orientation, in which a first edge of each said display faces the other display and a second orientation, in which a second edge of each said display, adjacent said first edge, faces the other display, said pivot points being located such that the distance between said facing edges is substantially identical when said displays are in either of their respective first and second orientations.

16. (previously presented) A computer display system according to Claim 15, wherein said pivot points are equidistant from said first and second edges.

17. (canceled)

18. (canceled)

19. (new) A dual computer display system comprising:

a first computer display connected to a computer having a first image surface for displaying a first computer image; and

a second computer display pivotably connected at a pivotable connection to the first computer display having a second image surface for displaying a second computer image and movable about at least two generally orthogonal axes about the pivotable connection, wherein the second computer display can assume a lateral operating position in which the first and second computer displays are oriented laterally and the second image is viewable by a person viewing the first image, wherein the second computer display is movable between a vertical operating position in which the first and second computer displays are oriented vertically and the second image is viewable by the person viewing the first image; the lateral operating position; and, an opposite position in which the second image is viewable by another person opposite the person viewing the first image, and wherein the second computer display is further movable to a stored position in which the second image surface faces the first image surface.
